

Could congenital heart defects be related to a genetic condition?

UHN

Information for patients and families

Reading this pamphlet can help you:

- Discover how congenital heart defects may be related to a genetic condition called 22q11.2 Deletion Syndrome
- Learn more about 22q11.2 Deletion Syndrome:
 - What it is
 - How best to care for it

What causes congenital heart defects?

As part of your care, your doctor will try to find the cause of the heart defect you were born with. There are many possible causes of heart defects. Many are related to genetic conditions.

One genetic condition that can affect the heart and other parts of the body is **22q11.2 Deletion Syndrome** or **22q11.2DS**.

People with 22q11.2DS are missing a tiny piece of one chromosome in each cell of their body. This can cause a wide range of health problems. **22q11.2DS is the second most common cause of heart defects.**

What does 22q11.2 Deletion Syndrome mean?

22q11.2	<ul style="list-style-type: none"> • 22 refers to chromosome 22. • Chromosome 22 is one of 23 pairs of chromosomes in every cell of your body. • You have 2 copies of chromosome 22. One copy is inherited from each parent. • q is the long arm of chromosome 22. Each chromosome has a short arm and a long arm. • 11.2 is a specific location on chromosome 22, where a tiny piece is missing from one of the two copies.
Normal chromosome 22	<p>The diagram illustrates two chromosomes. The top one is a normal chromosome 22, shown as a blue rod with a purple band representing the 11.2 region. The bottom one is a chromosome 22 with a deletion at the 11.2 region, where a small section of the purple band is missing. A bracket above the long arm is labeled 'q is the long arm', and an arrow points to the missing section with the label '11.2 is the location of the deletion'.</p>
Chromosome 22 with q11.2 deleted	
Deletion	A tiny piece of a chromosome is missing or 'deleted'.
Syndrome	A health condition with many features.

For more information, please visit our website: 22q.ca

For referral information, please visit
<http://22q.ca/medicalprofessionals/referral-information/>

Depending on your needs, you may have appointments with one or more of these health care providers:

- **Genetics expert in 22q11.2DS**
- **Psychiatrist**
- **Endocrinologist**
- **Neurologist**
- **Social Worker**
- **Registered Dietitian**

Cardiologists from the Toronto Congenital Cardiac Centre for Adults (TCCCA) are an important part of the Dalglish Clinic team.

The health care providers involved in your care will:

- Provide timely and effective care for 22q11.2DS
- Provide regular and careful monitoring of your health
- Give you information and support
- Connect you with local resources and peer support as needed
- Help coordinate care

What are some of the common features of 22q11.2DS?

- Congenital heart defects (heart defects present from birth)
- Learning difficulties and/or intellectual disability
- A nasal voice
- Anxiety or schizophrenia
- Low calcium levels
- Thyroid problems
- Seizures or epilepsy

22q11.2DS is a condition that affects many areas of the body. People with 22q11.2DS are affected in different ways, even if they are from the same family. The number and severity of features vary from person to person.

Many adults have not yet been diagnosed with 22q11.2DS because of the wide range of possible symptoms. Also, medical professionals may not recognize the symptoms as 22q11.2DS.

What causes 22q11.2DS?

About 1 in 2000 people are born with 22q11.2DS. Newborns are not tested for this syndrome on standard newborn screening.

Usually the 22q11.2 deletion occurs as a new genetic change in a family. It is not typically passed down (inherited) from a parent. Only about 1 out of 10 people with the 22q11.2 deletion have a parent who is also affected. In either case, nothing the parent did or did not do caused the deletion to happen.

How can I find out if I have 22q11.2DS?

Your doctor may order a blood test to look for the 22q11.2 deletion if you have a congenital heart defect, and especially if there is also another feature of 22q11.2DS, such as:

- Learning difficulties and/or intellectual disability
- Nasal sounding voice
- Anxiety or schizophrenia
- Low calcium levels

If you have features of 22q11.2DS, your doctor can also refer you to The Dalglish Family Hearts and Minds Clinic to be diagnosed. **Genetic testing is recommended for everyone with an intellectual disability.**

Knowing the diagnosis can benefit you in these ways:

- ✓ Your doctors will have more information when they take care of you.
- ✓ You may be able to better plan for health related issues before they happen.
- ✓ You can get the help that you need, such as social and/or financial support.
- ✓ You can have genetic counselling and get access to specific resources to learn about this diagnosis and the chances of having children who are also affected.

What happens if I have 22q11.2DS?

Most adults with 22q11.2DS manage well with support and health care tailored to their specific needs.

If you have 22q11.2DS, your doctor can refer you to The Dalglish Family Hearts and Minds Clinic, which is located at the Toronto General Hospital. This is a specialty clinic with a team of health care providers who are familiar with the syndrome. See page 6 for referral information.
